Sage Intacct Sandbox

Update processes with confidence

A Sage Intacct Sandbox environment enables low-risk business process improvement and transformation. A sandbox environment empowers organizations to be more strategic and validate changes without comprising their active Sage Intacct system, allowing more focus on the business.

What is a Sandbox Environment?
A Sage Intacct Sandbox environment is a replica of your production environment. It contains all of your transactional data, configurations, and customizations—refreshed four times a year without any additional set up.

Benefits of a Sandbox Environment
Facilitate rapid decision making
You can experiment with configuration changes or new capabilities before pushing them live to their active production environment. You get to use your actual data to test new processes and see the impact before making a decision. Make more informed process and customization decisions by taking advantage of all the data in your Sage Intacct system.

Make changes confidently

Avoid unintended impacts to your routine processes by testing or training in a sandbox. In a sandbox environment, you have the freedom to attempt test transactions and make different configuration choices and safely assess their value. You can turn features on, test them out, and then refresh your sandbox to revert it back to your current active system state—without involving IT or technical resources.

Test integrations before you go live

When integrating with a new system, organizations can test the integration in the sandbox environment to ensure stability and setup before pushing live to the organization.

Increase staff productivity

A sandbox environment gets new staff up-to-speed quickly. They can learn and make mistakes without comprising your live data.

This also allows current staff the opportunity to train on new skills or areas of the business while minimizing risk. Enhance the learning experience by training on your organization's actual data set.

Champion change without risking what's working

A Sage Intacct Sandbox environment provides a safe, realistic environment for training and testing, while giving organizations the flexibility to meet changing conditions and maintain their competitive advantage. The sandbox environment can accelerate growth and innovation by empowering the finance team to consider new business models, new ways to work, and understand the impact of each change.
